10. A composition comprising a compound of the formula Ib:

wherein:

R^{1b} is selected from  ,  , 

5 , , ,

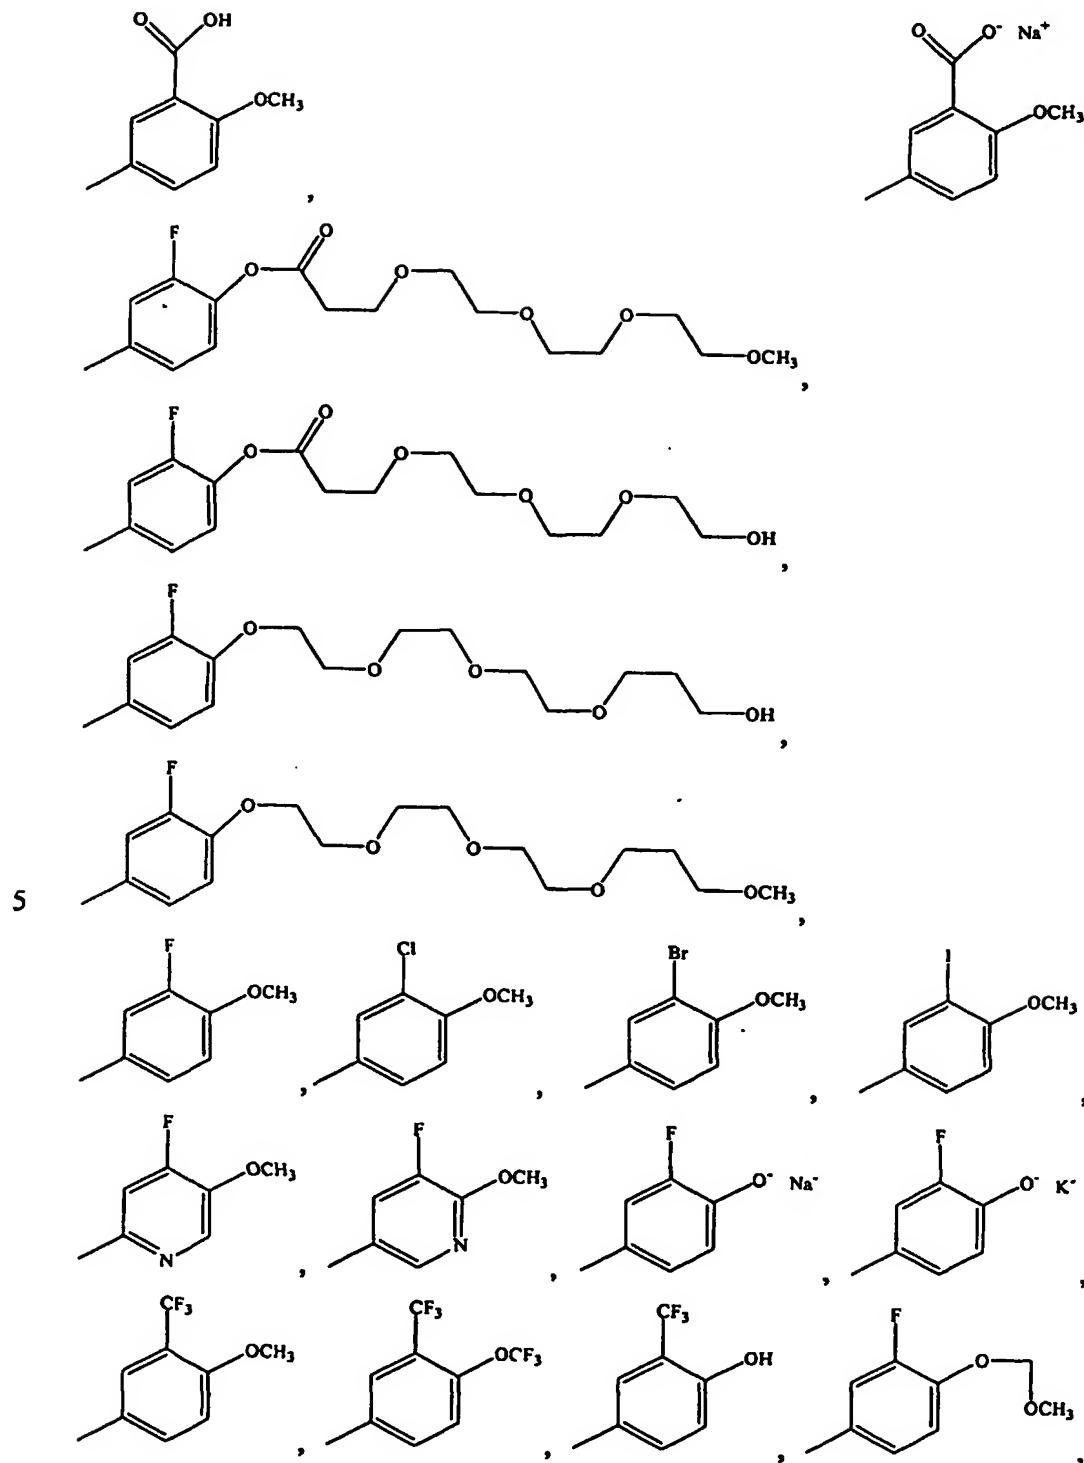

The figure displays four chemical structures side-by-side:

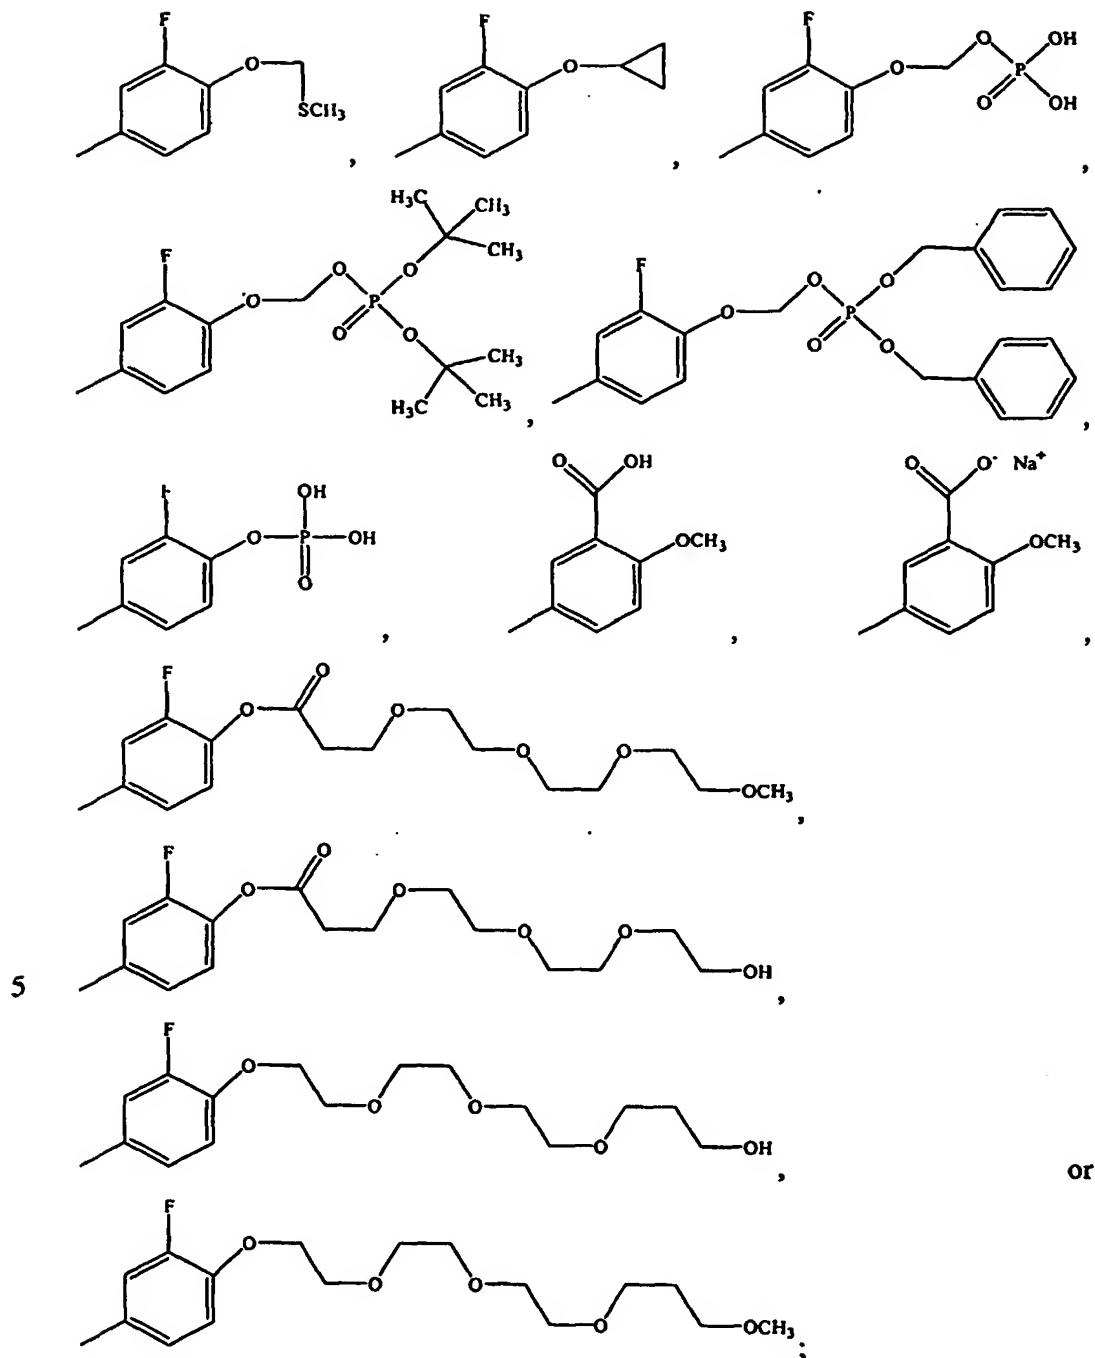

- 4-fluorophenoxide**: A benzene ring with a F atom at position 4 and an $\text{O}^- \text{ K}^+$ group at position 1.
- 4-(trifluoromethyl)anisole**: A benzene ring with a CF_3 group at position 4 and an OCH_3 group at position 1.
- 4-(trifluoromethyl)phenyl trifluoroacetate**: A benzene ring with a CF_3 group at position 4 and an OCF_3 group at position 1.
- 4-(trifluoromethyl)phenol**: A benzene ring with a CF_3 group at position 4 and an OH group at position 1.

The figure shows three chemical structures of substituted benzyl ethers. Each structure consists of a central benzene ring with two methyl groups at the 1 and 4 positions. At the 2 position, there is a methylene group (-CH₂-). Attached to the 2-position methylene group is a substituent: in the first structure, it is an ethoxy group (-OCH₃); in the second, it is a propylthio group (-SCH₃); and in the third, it is a cyclopropylmethyl group (-OC(CH₃)₂). The fluorine atom is located at the para position relative to the ether linkage.

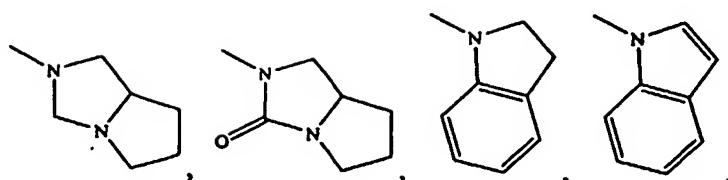

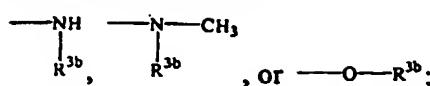

The figure displays two chemical structures. On the left is 4-fluorophenyl diethyl phosphate, featuring a 4-fluorophenyl group attached via an oxygen atom to a phosphate group (PO_3^{2-}). The phosphate group is further esterified to two ethyl groups. On the right is a methylated derivative where one of the phosphate esterified ethyl groups is replaced by a dimethylallyl group ($\text{CH}_2\text{C}(\text{CH}_3)_2$).

The figure displays two chemical structures. On the left is 4-fluorobiphenyl-4-phosphate, which consists of a biphenyl ring system where one phenyl ring is substituted at the 4-position with a fluorine atom and another at the 4-position with a phosphate group (-OPO₃²⁻). On the right is 4-fluorobiphenyl-4-phosphate monohydrate, which is identical to the phosphate except it has an additional water molecule (OH) attached to the phosphate oxygen.
